

Study Flashcards

Ishitha Gabriel

1. Project Problem Statement

Students need a simple way to create and study their own flashcards. Most existing tools are complicated, require accounts, or have too many features. This project is a basic browser-based flashcard app where students can create cards, review them, and test themselves with a simple scoring game — all without needing to sign up or install anything.

2. Concise Design Overview

The solution is a website built with HTML, CSS, and JavaScript. It has three main parts:

- A page where users can create flashcards by entering a question and answer
- A review mode where cards can be flipped to check answers
- A game mode where users are scored based on their answers

All data is stored in the browser so cards are still there after refreshing the page. No server or database is needed.

3. Scope Statement

The goal is to have a working flashcard website by June 4. The project includes:

- Creating, viewing, and deleting flashcards
- Flipping cards to reveal the answer
- A game/quiz mode with a score
- A clean, readable layout

The project does not include user accounts, a server, sharing between users, or a mobile app.

4. Timeline

Milestone	Dates	Description
Project Setup & Planning	May 8 – May 11	GitHub repo created, group norms and spec document complete
Building the Website	May 12 – May 18	HTML structure, CSS styling, and core flashcard logic complete

Milestone	Dates	Description
Game Mode & Testing	May 19 – May 26	Game/scoring feature added, bugs identified and fixed
Final Touches & Submission	May 27 – June 4	Documentation, README, UI polish, and final submission

5. Test Plan

Testing will be done manually by using the website and checking that each feature works as expected.

Things to test:

- Creating a flashcard saves it and shows it on the page
- Clicking a card flips it to show the answer
- The game mode keeps track of the score correctly
- Cards are still there after refreshing the page
- Submitting a blank card shows an error instead of creating an empty card

A peer will also be asked to try using the site to check that it is easy to understand.

6. Risks and Contingency Plans

Risk	Probability	Mitigation Plan
Bugs in JavaScript causing features to not work correctly	Medium	Test features manually after each addition and fix issues as they come up
Running out of time on a task	Medium	Prioritise core features first; leave polish until the end
Accidentally losing or overwriting code	Low	Commit to GitHub regularly to keep a backup of all progress
Website looks different across browsers	Low	Check the site in multiple browsers before final submission
